Lasix® (furosemide) is a loop diuretic used to treat fluid retention (edema) in conditions such as heart failure, kidney disease, and liver disease. It works by increasing the excretion of water and sodium from the body.

Common side effects of Lasix include increased urination, dizziness, lightheadedness, and dehydration. More serious side effects can include low potassium levels, which may lead to muscle weakness and irregular heartbeats. Patients should be monitored for these symptoms, especially if they are taking other medications or have underlying health conditions.

Lasix is typically administered orally as a tablet or intravenously as an injection. The dosage is determined by the patient's condition and response to treatment. It is important to follow the prescribed regimen and to report any adverse effects to the healthcare provider.

- Common side effects include increased urination, dizziness, and dehydration.
- More serious side effects include low potassium levels and irregular heartbeats.

Patients should avoid alcohol and other diuretics while taking Lasix, as this can increase the risk of dehydration. It is also important to maintain a balanced diet and stay hydrated. Regular monitoring of kidney function and electrolyte levels is recommended during treatment.

Lasix is a potent diuretic and should be used with caution. Patients should be advised to stop taking the medication if they experience severe dizziness, fainting, or a rapid heartbeat. The healthcare provider should be consulted if any of these symptoms occur.

1. 在 1994 年 12 月 31 日以前，所有在本行办理存款业务的单位和个人，均应按本行规定的利率缴纳存款利息所得税。

2. **Insertion of the catheter into the vein.**
 The catheter is inserted into the vein, and the insertion site is secured with a suture and a clamp.

After the catheter is inserted, the insertion site is secured with a suture and a clamp. The catheter is then connected to a drip chamber and a syringe. The drip chamber is placed in a sterile container, and the syringe is used to aspirate blood from the catheter to confirm placement. The insertion site is then covered with a sterile dressing.

IV **Insertion of the catheter into the vein.**
 The catheter is inserted into the vein, and the insertion site is secured with a suture and a clamp. The catheter is then connected to a drip chamber and a syringe. The drip chamber is placed in a sterile container, and the syringe is used to aspirate blood from the catheter to confirm placement. The insertion site is then covered with a sterile dressing.

After the catheter is inserted, the insertion site is secured with a suture and a clamp. The catheter is then connected to a drip chamber and a syringe. The drip chamber is placed in a sterile container, and the syringe is used to aspirate blood from the catheter to confirm placement. The insertion site is then covered with a sterile dressing.

Steri-Strips™ (**adhesive strips**) are used to secure the catheter to the skin. The strips are applied to the skin, and the catheter is secured to the strips. The strips are then covered with a sterile dressing.

After the catheter is inserted, the insertion site is secured with a suture and a clamp. The catheter is then connected to a drip chamber and a syringe. The drip chamber is placed in a sterile container, and the syringe is used to aspirate blood from the catheter to confirm placement. The insertion site is then covered with a sterile dressing.

If you have questions or concerns, contact your healthcare provider. A member of your care team will answer Monday through Friday from 9 a.m. to 5 p.m. Outside those hours, you can leave a message or talk with another MSK provider. There is always a doctor or nurse on call. If you're not sure how to reach your healthcare provider, call 212-639-2000.
